

Lab 4, Create a dataset

Everything in information technology is based on data. The mainframe has an extremely efficient way to manage data, and this lab will introduce you to the creation of data sets.

Go to the Data Set Utility (3.2 from the ISPF Primary Option Screen)

Make sure your ID is in the Project field, and name your new data set as shown above (name your data set **LAB4**, NOT LAB7). Make sure you put an “A” in the option area to allocate the data set. **PS this screen and label it “Creating a data set”**

Note: In the VOLUME SERIAL FIELD, LEAVE IT BLANK. This will avoid “out of space” errors.

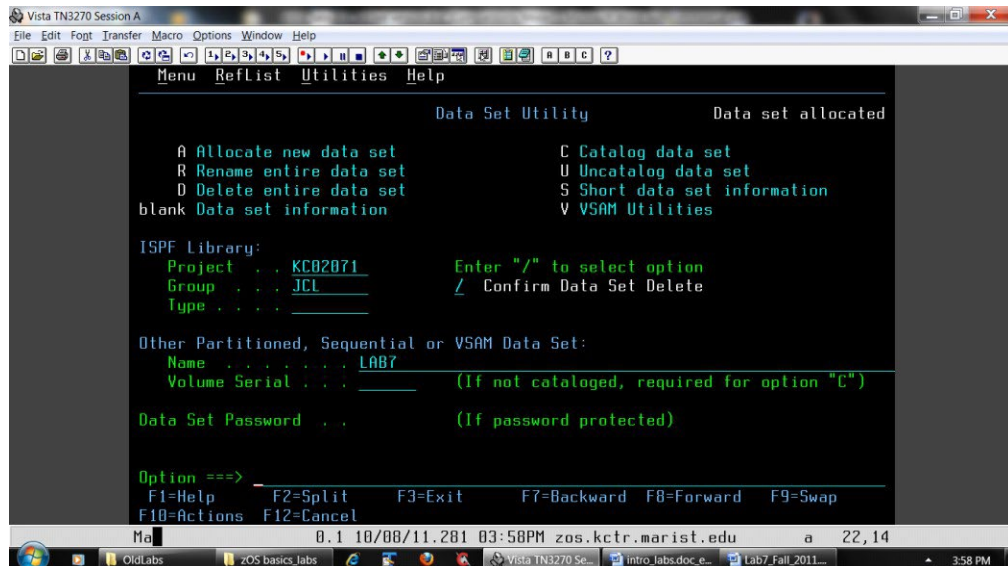

Lab 4 – create a data set Page 2

Use these parameters:

- Complete the indicated fields and press Enter:
 - Space Units = TRKS
 - Primary quantity = 10
 - Secondary quantity = 5
 - Directory blocks = 10
- Record format = FB
- Record length = 80
- Block size = 0 (this tells z/OS to select an optimum value)
- Data set type = LIBRARY

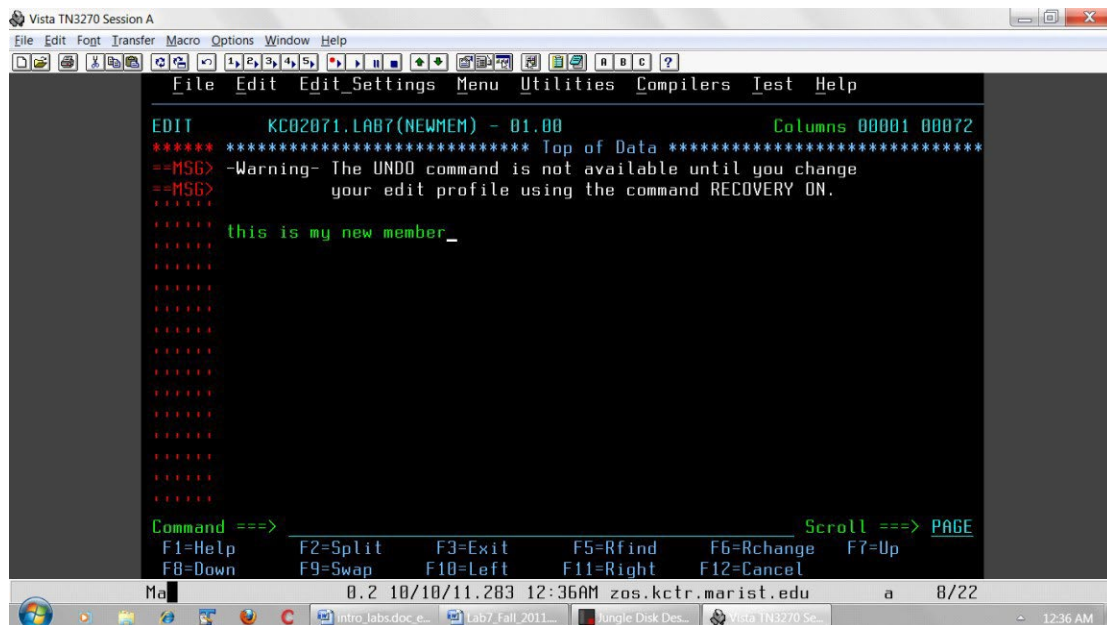

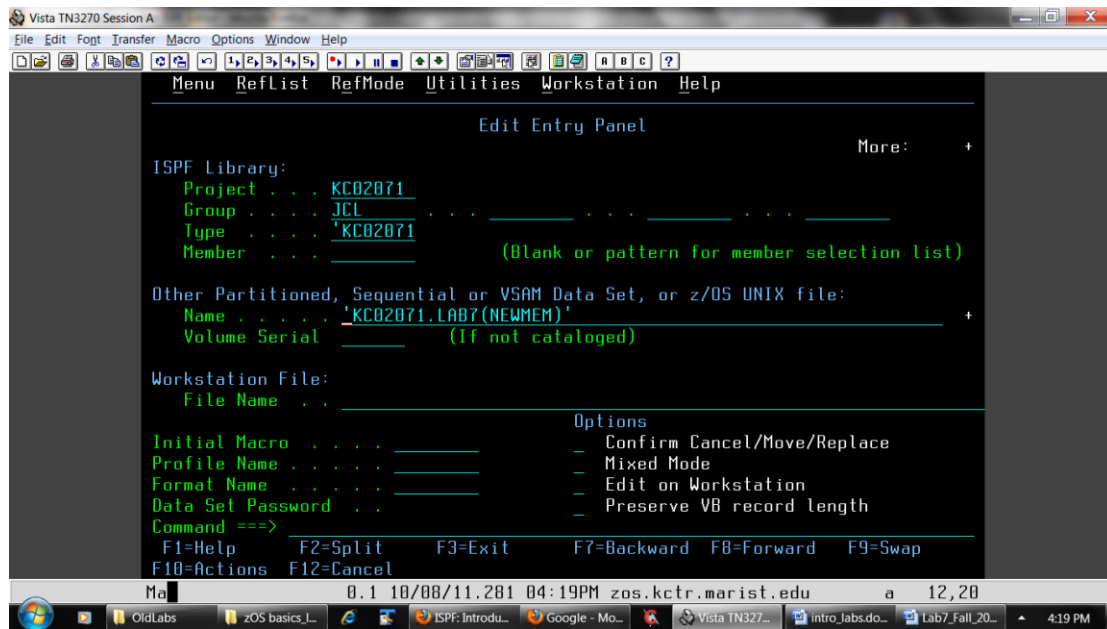

PS THIS SCREEN AND LABEL IT “My dataset parameters”

When the parameters are in, press ENTER and you will have the data set allocated.

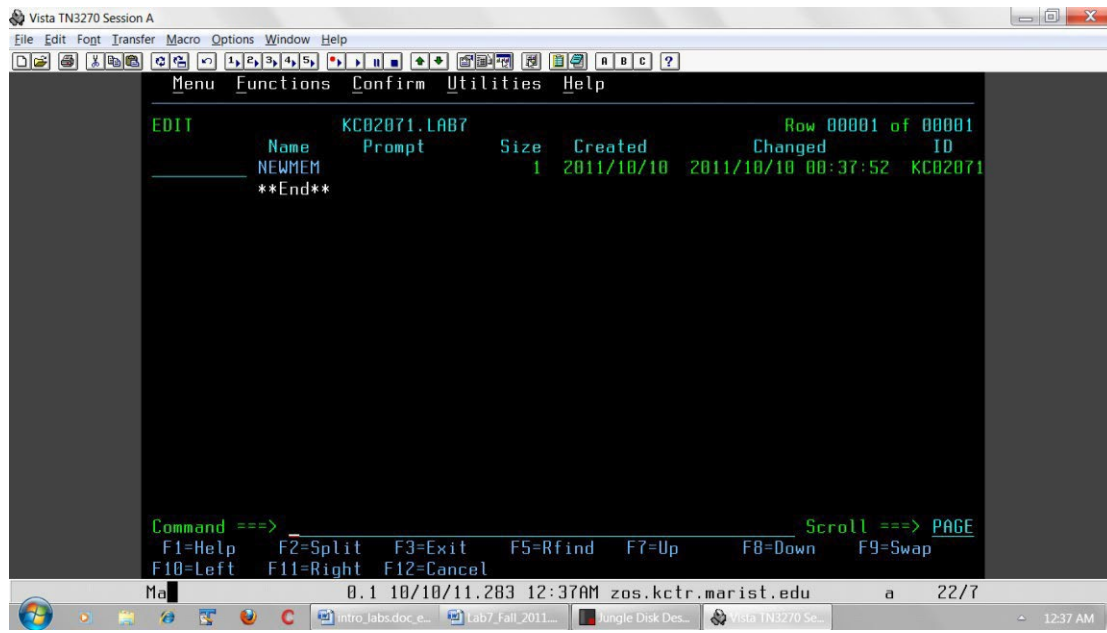

Data Set is allocated

Lab 4 – create a data set Page 3

Add some text and save the new member (you can either type SAVE on the command line or press F3 to SAVE and EXIT the data section). **PS THIS SCREEN AND LABEL IT “TEXT IN MY NEW MEMBER”**

Lab 4 – create a data set Page 4

My new member is created.

Now create two more datasets (naming them LAB42 and LAB43). For the 2nd and 3rd data set **ONLY PRINT SCREEN THE DATA SET AND NOT ALL OF THE STEPS LEADING UP TO ITS CREATION. LABEL EACH SCREEN SHOT WITH THE NAME OF THE NEW DATA SET.** Then write a 100-150 word summary of this lab and post it to Canvas.

Now you know how to create a data set on the mainframe!
